

## Slime Recipe

½ C white or clear school glue

½ teaspoon baking soda

Food color

Essential oil for scent (optional)

Shaving cream-(optional) anywhere from 1 Tablespoon to 1 Cup, depending on how spongy you want it to be

1 Tablespoon contact lens cleaning solution

## Directions

In a large bowl, mix glue and baking soda

Add color of your choice, mix

Add scent if you want to and mix again

Add shaving cream if you want your slime to be a bit puffy, mix

Add lens cleaning solution and mix

Your slime will be very slimy and sticky at first. Do not worry, it will get less sticky as you work it with your hands and more air is incorporated into it.

Keep pulling it apart and smooshing it together repeatedly until it is not sticky anymore. If it seems like it is just too slimy and not getting less sticky, you can add another squirt of lens cleaning solution, and it should correct things.

If you look on the internet, you will find that there are many variations on the recipe. For example, you can use Borax instead of the eye cleaning solution to make it turn into slime.
